Procera to Equip ColoSpace's New Data Center

[Procera Networks, Inc.](#), a developer of network security and compliance systems, announced yesterday that [ColoSpace](#), which provides collocation and managed services, is integrating its new Internet data center facility in the Boston area with Procera's OptimIP intelligent network appliance systems.

Procera now enables ColoSpace to offer new SOX-compliant services reducing ColoSpace's cost of data transport for disaster recovery and other managed security services. Procera's OptimIP intelligent network appliance provides a transparent application-oriented networking overlay to ColoSpace's Cisco network infrastructure for secure VLANs partitioned for each customer's data center requirements.

The new ColoSpace facility provides essential disaster recovery and other managed services. Procera enables ColoSpace to securely provision T-3, OC-3 and higher capacities at a substantial discount over alternative providers.

"Procera enables us to offer an essential security, auditing and control overlay without disrupting our existing Cisco infrastructure. This enables our enterprise customers to implement disaster recovery operations that adhere to the SAS 70 standard in compliance with SOX 404 audit requirements and take advantage of our 100-percent uptime service level agreement with full confidence in the security of their outsourced services," said Aaron Sawchuk, Chief Technology Officer of ColoSpace.

"The OptimIP's unique capabilities to secure and control shared infrastructure is a tremendous boon to managed service providers and their customers. Procera offers a new economic model to managed service providers through unique features that Cisco does not offer or that would require multiple point products to achieve," said Gary J. Johnson, Senior Vice President of Sales and Marketing for Procera Networks.
